Participate in research:
SerOzNET: Studying the COVID-19 vaccine in Monash patients with cancer

Patients with cancer are eligible and recommended to receive the COVID-19 vaccination.

Monash researchers on behalf of Cancer Australia are studying how well the COVID-19 vaccine works in patients with cancer, and what the side effects are.

Am I eligible?

You must have a cancer diagnosis, have not received your COVID-19 vaccine and meet **one or more** of the following criteria:

- Currently on chemotherapy
- Currently on immunotherapy
- Currently on hormonal therapy
- Received chemotherapy 6-12 months ago
- Have an allergy to either a vaccine or an anticancer treatment
- Have a diagnosis of multiple myeloma, CLL, or low grade lymphoma

What is involved?

If eligible for the study, you will receive:

- The COVID-19 vaccination and booster offered through Monash Health or a local vaccination hub
- Assistance with booking your vaccine from a research coordinator

If enrolled in the study, you will participate in:

- Blood tests, before the vaccine and at time points after the vaccine
- Surveys to report side effects and how you are feeling

How will this help?

You can help us study the COVID-19 vaccine response, to help inform patients and doctors worldwide about how the vaccine works for patients with cancer, and how to best protect them (and you) in the future
